

API utilizada: <https://potterdb.com>

Documentación: <https://docs.potterdb.com/apis/rest>

Funcionamiento:

The screenshot shows a REST client interface for the Harry Potter API. The request is a GET to `https://api.potterdb.com/v1/characters?filter(name_cont)=Potter`. The response is a 200 OK status with a JSON body containing character details for Abraham Potter.

**Query Params**

Key	Value	Description
<input checked="" type="checkbox"/> filter(name_cont)	Potter	

**Body**

```
{
  "id": "9be9cf99-2e43-4cbe-933a-a0976acd908e",
  "type": "character",
  "attributes": {
    "slug": "abraham-potter",
    "alias_names": [],
    "animagus": null,
    "blood_status": "Pure-blood or half-blood",
    "boggart": null,
    "born": "1m or before 1676",
    "died": "After 1693 (before reaching 'old age')",
  }
}
```
